

Eaton Helps Customers Keep Data Centers Current With New UPSgrade UPS Trade-in Program

June 30, 2009 ... Eaton today introduced the new Eaton UPSgrade™ program, designed to offer end-users an opportunity to upgrade and dispose of their outgrown or outdated equipment. It grants them affordable access to the industry's latest uninterruptible power system (UPS) technology at discounted prices to bolster their power protection solutions. Eaton UPS products are available up to 6 kVA with standby, line-interactive and online technologies.

“Whether you're new to Eaton or a longtime customer, anyone in the market for a power protection upgrade will benefit from our new offering,” said Matt Cheap, product manager, Eaton. “There is no better way to address current or future expansions to your ever-growing power needs than the new Eaton UPSgrade program.”

The UPSgrade program gives end-users the ability to “be green” in several ways. Eaton offers environmentally sound disposal and recycling of all expended UPS components at no cost. This is not only convenient for the customer but it minimizes the amount of material that ends up in landfills. In addition, an upgrade to a higher efficiency Eaton UPS will reduce heat production and utility costs in the data center.

Eaton's UPSgrade program includes more than 130 units to select from when upgrading data center equipment, including the latest UPS products such as the Eaton 5130 UPS, Eaton 9130 UPS and Eaton 9135 UPS. Though all models of Eaton's UPS systems provide continuous coverage, each system has its own unique features to support end-users. The Eaton 5130 offers more power in a smaller footprint than previous generation equivalents. It is value-priced with many features you would expect to find in higher-priced systems.

The 9130 is designed to provide superior power protection to IT and networking data center equipment, medical systems and manufacturing process control—anywhere critical equipment and applications require clean, continuous power. The versatile nature of the 9135 UPS allows IT managers to check the status of the system from any location and delivers superior power protection for medium-density data centers such as banking and retail systems.

A one-stop partner, Eaton provides UPSs, DC Power systems, award-winning power management software and world-class service offerings to render confidence that power problems will not disrupt your systems, data or critical operations.

For more information on which UPS system works best for your organization's needs, visit Eaton's online UPS selector at www.eaton.com/powerquality. To learn more about the UPSgrade program, locate a reseller or contact an Eaton representative, visit www.eaton.com/upsgrade.
